

DUPLEX

Installation positions

Compact DUPLEX units with heat recovery are supplied in a wide range of versions, installation types and port configurations. This positional versatility is a significant advantage of this series of heat recovery units and makes it considerably easier for the designer to find a perfect spot for installing the air handling unit in a building, both in renovated existing premises and in new buildings.

An optimum port configuration makes installation easier and shortens the length of piping, which results in lower heat loss of the piping and a more economical system.

VERSIONS

The units are supplied in two basic versions depending on the type of environment:

Indoor version

Indoor units are supplied with basic or double insulation. They are intended only for basic environments, i.e. they must not be installed outdoor under any circumstances.

Rooftop versions (for outdoor use)

Rooftop units differ from the indoor version particularly in the following:

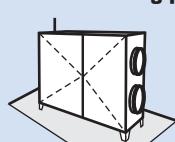

- They always have double insulation
- The unit has a roof to protect it from the weather
- The external surface of the unit is finished with a special paint resistant to weather changes and thanks to its composition it is also suitable for seaside areas
- The structural frame of the unit is made of a special stainless alloy, also resistant to seaside conditions
- The units are optionally supplied with a base frame to make installation on the roof easier; adaptors for passage through the roof may also be supplied (only vertical designs)

TYPES

The unit type determines its installation position in the building. Individual positions differ mainly in the position of the condensate pan (in winter it collects condensate that forms in the heat recovery exchanger; in summer condensate from the chiller). Other differences include the position of fans (in most motors a horizontal position of the axle is required) and the type of heating and cooling registers used.

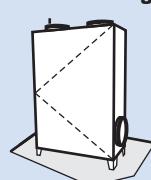

Individual types naturally differ in mounting accessories - see notes for individual types.

Floor-standing position (indoor version)

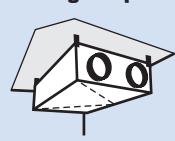

A basic position for installation on the floor or a mounting bracket on the wall. Delivery includes condensate outlets (1 – 3 depending on the unit modification) and feet for the installation of the unit. It is recommended mounting the unit on spring washers.

Floor-standing vertical position (indoor version)

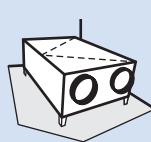

The unit is arranged vertically, may also be installed on the floor or a bracket. Delivery parts identical to the upright position.

Ceiling-suspended position (indoor version)

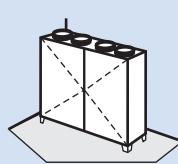

Ideal for confined buildings, thanks to its flat design it can be installed in relatively low spaces. Delivery includes suspension clamps. It is recommended installing the unit on spring washers to prevent the transfer of noise and vibrations into the building structure.

Floor-standing position (indoor version)

The floor is suitable especially for attics. Delivery includes condensate outlets (1-3 depending on the unit modification) and feet for the installation of the unit.

Upright position (indoor version)

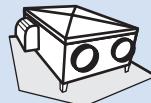

A special DUPLEX unit type with all four connecting ports on the top. Possible medium connections (heating / chilled water, electrical) are also from the top. The unit may be pushed to the wall from both sides or there can be other devices immediately next to it.

Vertical position (rooftop version)

A basic rooftop position. This position utilizes the advantage of direct passage through the roof via the base frame with pipe adaptors - this solution makes installation considerably easier, lowers heat loss caused by piping laid on the roof and simplifies the hydro-insulation of the roof shell. Delivery includes condensate outlets (1 – 3 depending on the unit modification, optionally heated) and feet for the installation of the unit. A base frame (with adjustable height) and piping adaptors are optional accessories.

Flat position (rooftop version)

The flat position is suitable for buildings where low-height air conditioning system installed on the roof is required, e.g. due to architectural considerations. Furthermore, it is the only rooftop unit type that allows using counterflow heat recovery exchangers. Delivery includes condensate outlets (1 – 3 depending on the unit modification, optionally heated) and feet for the installation of the unit.

PORT CONFIGURATION

All unit types may be delivered with a range of port configurations, i.e. for most of the ports a position may be selected - standard or atypical. For design reasons it is not possible to deliver all combinations - see notes for individual configurations on the following pages of this brochure. In addition, it is of course possible to select a shape (round, rectangular) and dimensions individually for every port.

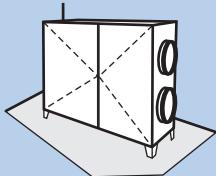

DESIGN SOFTWARE

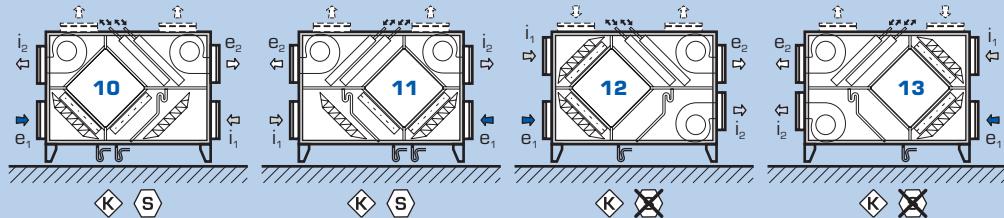

To design DUPLEX units it is possible to use the advantage of a special design software, to be found on our website at www.atrea.cz, or send a request to our address. The whole process of selecting a suitable version and configuration of ports is a very intuitive one.

INSTALLATION POSITIONS - INDOOR UNITS

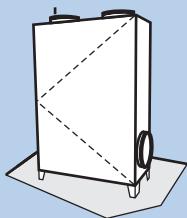

FLOOR-STANDING HORIZONTAL POSITION

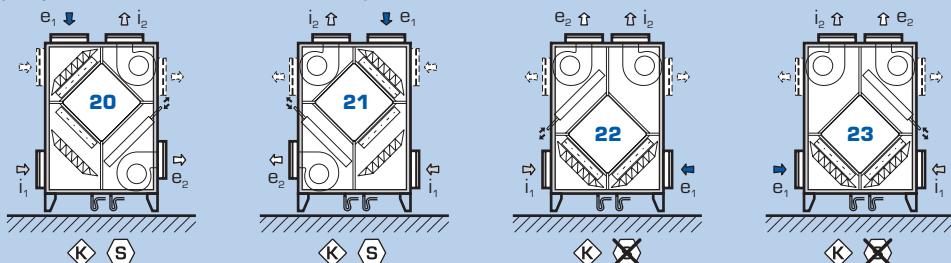

position 10, 11 (DUPLEX 2000 – 8000, DUPLEX-S 1500 – 5600) – Access door side view
position 12, 13 (DUPLEX 2000 – 15000, DUPLEX-S 1500 – 5600) – Access door side view

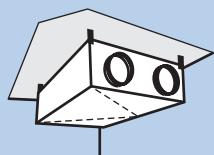

FLOOR-STANDING VERTICAL POSITION

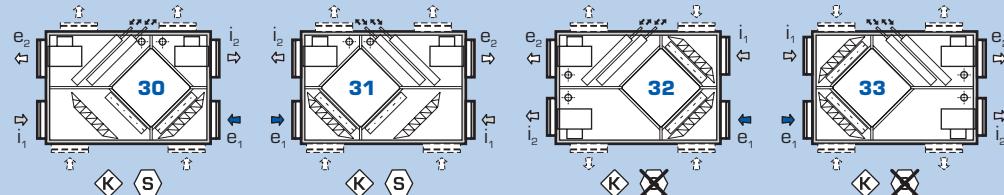

position 20 – 23 (DUPLEX 2000 – 8000, DUPLEX-S 1500 – 5600) – Access door side view
(not possible in CHF, CHW modification)

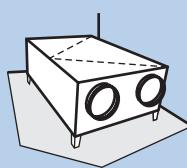

CEILING-SUSPENDED POSITION

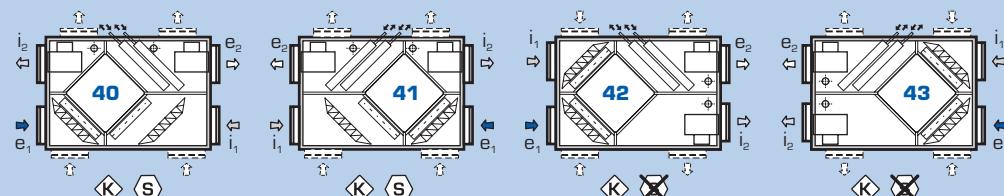

position 30 – 33 (DUPLEX 2000 – 6000, DUPLEX-S 1500 – 5600) – Top view

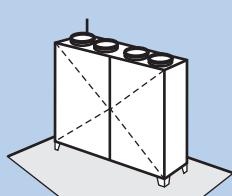

FLOOR-STANDING FLAT POSITION

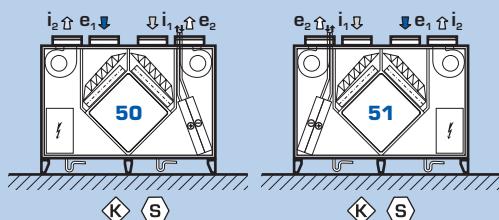

position 40 – 43 (DUPLEX 2000 – 6000, DUPLEX-S 1500 – 5600) – Top view

UPRIGHT POSITION

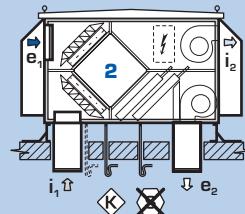

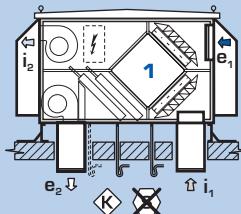

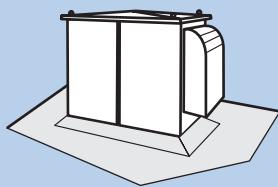

position 50 and 51 (DUPLEX 2000 – 8000) – Access door side view

INSTALLATION POSITIONS - ROOFTOP UNITS

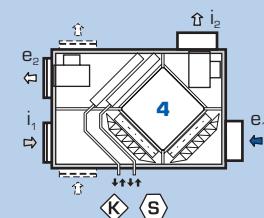

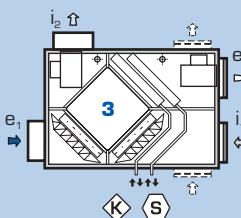

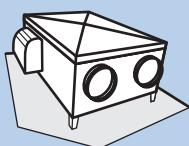

HORIZONTAL POSITION

position 1/0 – 1/2 and 2/0 – 2/2 (DUPLEX-N 2000 – 15000) – Access door side view

FLAT POSITION

position 3/8 – 3/14; 4/8 – 4/14 (DUPLEX-N 2000 – 6000, DUPLEX-NS 1500 – 4500) – Top view
